

Water Quality

Water Quality

Water quality is a critical component of environmental health. It involves monitoring various parameters such as pH, dissolved oxygen, and turbidity to ensure the safety and sustainability of our water resources.

Water Quality

Water quality is a critical component of environmental health. It involves monitoring various parameters such as pH, dissolved oxygen, and turbidity to ensure the safety and sustainability of our water resources.

Water quality is a critical component of environmental health. It involves monitoring various parameters such as pH, dissolved oxygen, and turbidity to ensure the safety and sustainability of our water resources.

Water Quality

Water quality is a critical component of environmental health. It involves monitoring various parameters such as pH, dissolved oxygen, and turbidity to ensure the safety and sustainability of our water resources.

Water quality is a critical component of environmental health. It involves monitoring various parameters such as pH, dissolved oxygen, and turbidity to ensure the safety and sustainability of our water resources.

Water quality is a critical component of environmental health. It involves monitoring various parameters such as pH, dissolved oxygen, and turbidity to ensure the safety and sustainability of our water resources.

Water Quality

Parameter	Unit	Value
pH		7.2
Dissolved Oxygen	mg/L	8.5
Turbidity	NTU	0.5

Water quality is a critical component of environmental health. It involves monitoring various parameters such as pH, dissolved oxygen, and turbidity to ensure the safety and sustainability of our water resources.

Water quality is a critical component of environmental health. It involves monitoring various parameters such as pH, dissolved oxygen, and turbidity to ensure the safety and sustainability of our water resources.
